Latent class analysis (LCA), a special type of finite mixture modeling, involves a categorical latent variable model that express the overall distribution of one or more observed variables as a mixture of a finite number of component distributions.

Applied Latent Class Analysis Training Course - Stats Camp

Topics include latent class analysis, latent class cluster analysis, modeling predictors and outcomes of latent class membership, and select extensions. Hands-on practice with Mplus is provided. This five-day camp is an intensive short seminar in the fundamentals of latent class analysis and finite mixture modeling.

In contrast, latent class parameters can be conditioned on continuous concomitant variables in a manner analogous to the analysis of covariance. For example, in a two-class model, the proportion of cases in the first latent class, say, might be represented as a function of a respondent characteristic such as scholastic aptitude (e.g., SAT score).

Latent Class Analysis (LCA) is a way to uncover hidden groupings in data. More specifically, it's a way to group subjects from multivariate data into "latent classes" groups or subgroups with similar, unobservable, membership. Latent implies that the analysis is based on an error-free latent variable (Collins & Lanza, 2013).

Enter Latent Class Analysis (LCA). LCA is a measurement model in which individuals can be classified into mutually exclusive and exhaustive types, or latent classes, based on their pattern of answers on a set of categorical variables.

What Is Latent Class Analysis? - The Analysis Factor

LATENT CLASS ANALYSIS Latent class analysis is a statistical method used to identify unobserved or latent classes of individuals from observed responses to categorical variables (Goodman, 1974). It is analogous to factor analysis which is commonly used to identify latent classes for a set of continuous variables (Gorsuch, R. L., 1974).
