The blood-brain barrier (BBB) is a highly selective semipermeable border that separates the circulating blood from the brain and extracellular fluid in the central nervous system (CNS). The blood-brain barrier is formed by endothelial cells of the capillary wall, astrocyte end-feet ensheathing the capillary, and pericytes embedded in the capillary basement membrane.

BBB - Wikipedia

The CNS has developed a series of barriers to protect itself from invading pathogens, neurotoxic molecules and circulating blood cells. These structures with diverse degrees of permeability include the blood-cerebrospinal fluid (CSF) barrier, the blood-brain barrier (BBB), the blood-retinal barrier and the blood-spinal cord barrier. Among these, the BBB is the most extensive and exclusive.

Nanoparticle-mediated brain drug delivery: Overcoming

Delivery of large molecule drugs across the blood brain barrier is increasingly being seen as an achievable goal. Several technologies have been described where following peripheral administration the molecules can be detected in the brain.

Exploiting transferrin receptor for delivering drugs

The blood-brain barrier (BBB) provides a constant homeostatic brain environment that is essential for proper neural function. An unusually low rate of vesicular transport (transcytosis) has been identified as one of the two unique properties of CNS endothelial cells, relative to peripheral endothelial cells, that maintain the restrictive quality of the BBB.

Blood-Brain Barrier Permeability Is Regulated by Lipid

The goal of this review is to describe the state-of-the-art techniques and methods that have been used so far in pharmaceutical research to evaluate the BBB function and assess the ability of drug-like molecules to permeate the BBB.

1st November 2018. A raised blood pressure, as a clinical sign, has always rather perturbed me. At medical school we were always taught "and this has not changed as far as I know" that an underlying cause for high blood pressure will not be found in ninety per cent of patients.

Lisdexamfetamine (contracted from L-lysine-dextroamphetamine) is a prodrug of the central nervous

system (CNS) stimulant dextroamphetamine, a phenethylamine of the amphetamine class that is used in the treatment of attention deficit hyperactivity disorder (ADHD) and binge eating disorder. Its chemical structure consists of dextroamphetamine coupled with the essential amino acid L-lysine.

Abstract. Nanomaterials offer new opportunities for cancer diagnosis and treatment. Multifunctional nanoparticles harboring various functions including targeting, imaging, therapy, and etc have been intensively studied aiming to overcome limitations associated with conventional cancer diagnosis and therapy.
